

INFORMATION SECURITY SERVICES

Intekras's Information Assurance division offers a broad suite of solutions designed to protect your most critical information assets and reduce the probability or impact stemming from an undesirable or unexpected event. From identifying and ranking vulnerabilities and threats to recommending where and how to mitigate the most serious business, operational, and technical exposures, *Intekras* is uniquely qualified to assist you in protecting and defending your information and information systems from all IT risks. More information on any of the IA solutions described below is available upon request.

Certification and Accreditation (C&A)

We believe that C&A is more than a compliance exercise. Our efforts are based upon the establishment of “continuous monitoring” capabilities — which can improve both compliance and near real-time risk management.

CORE SECURITY™ Products/Services

In an expanding partnership with Core Security Technologies, we provide their flagship product, CORE IMPACT® Pro and their new CORE INSIGHT Enterprise™ products together with a “service surround” that will assist in configuring the tools, establish repeatable penetration testing protocols, and translate results into risk treatment strategies and tactics.

Disaster Recovery/COOP

From performing a Business Impact Analysis to assessing and improving your COOP, our experts are able to assist in the mitigation of continuity risk.

Identity & Access Management (IAM)

Through its Managed IAM Services, *Intekras* provides operational solutions that integrate Logical and Physical IAM. We can assist in the design, implementation, deployment and operation of an integrated identity management system to standardize access management across platforms for users, devices, applications and business processes, as well as physical security points such as biometrics, smart-cards and badge readers.

Incident Response & Digital Forensics

When faced with resource misuse, policy abuse, denial-of-service, or data breach, *Intekras* consultants can investigate the circumstances behind the event and provide assistance in remediation — all the while complying with Federal Rules of Civil Procedure and eDiscovery processes.

Independent Verification & Validation

Intekras consultants — skilled in such disciplines as project management, systems analysis, business process design and risk management — seek to determine whether a solution (either in development or production) meets expectations and to identify where the project risks lie.

IT Audit

Our experience in developing and assessing admissibility and audit procedures (surrounding both control rich and control deficient environments) enables *Intekras* to evaluate the effectiveness of an organization's IS control environment to determine audit readiness.

INFORMATION SECURITY SERVICES (cont.)

IT Governance Risk Review

Intekras helps to establish the organizational structure and business processes you need to implement an effective, sustainable IT Governance Risk management program and create a risk-minded organization.

IT Security Architecture Review

Security is a 'defense in depth' methodology, managed through a systematic architectural approach that is built on a standards-based security foundation. Our comprehensive security review will identify and enhance system infrastructure and support.

IT Security Operations Review

Intekras is able to apply accepted best practices and risk frameworks to ensure that all aspects and functions of the security operation run in the most efficient and effective manner, using CMMI, COBIT, SSE-CMM, ISO 27000, and NIST SP-800.

IT Security Risk Assessment

Intekras risk assessments utilize the most current risk frameworks such as the ISO 27000 series and the NIST SP-800 guidelines to identify, analyze and evaluate the most critical exposures and recommend ways to mitigate, transfer or accept those risks.

Penetration Testing

Through active penetration testing, our security experts are able to determine the feasibility of an attack and the impact a successful exploit, if perpetrated, may have.

Vulnerability Assessment

Our experienced security personnel are able to perform an extensive assessment of vulnerabilities across your infrastructure and review your incident response capabilities, operational protocols, policies and procedures, etc. to determine the extent of the damage that could result from a data breach or other security failure.
